

Initialization & References

...

Fun times!

masks required

A note

- After lecture you should understand maybe 50% of the material
- To fully understand it you need practice and time to reflect
- We don't expect you to grasp everything!
- If you're feeling overwhelmed or lost, come talk to us!

Today

- **Streams recap**
- Initialization
- References

Definition

stream: an abstraction for input/output. Streams convert between *data* and the *string representation of data*.

Output Streams

<< is the stream
insertion operator

- Have type `std::ostream`
- The stream can only **receive** data using the << operator
 - Converts any type into string and **sends** it to the stream
- `std::cout` is the output stream that goes to the console

```
std::cout << 5 << std::endl;  
// converts int value 5 to string "5"  
// sends "5" to the console output stream
```

Output File Streams

- Have type `std::ofstream`
- The stream can only **receive** data using the `<<` operator
 - Converts data of any type into a string and sends it to the **file stream**
- Must initialize your own `ofstream` object linked to your file

```
std::ofstream out("out.txt");  
// out is now an ofstream that outputs to out.txt  
  
out << 5 << std::endl; // out.txt contains 5
```

Input Streams

`>>` is the stream extraction operator

- Have type `std::istream`
- The stream can only **send** data using the `>>` operator
 - ***Converts*** a string from the stream into data
- `std::cin` is the input stream that gets input from the console

```
int x;  
string str;  
std::cin >> x >> str;  
// reads exactly one int then one string from console
```

Input File Streams

- Have type `std::ifstream`
- The stream can only **send** data using the `>>` operator
 - Reads in data from a file and extracts it into variables
- Must initialize your own `ifstream` object linked to your file

```
std::ifstream in("out.txt");  
// in is now an ifstream that reads from out.txt  
string str;  
in >> str; // first word in out.txt goes into str
```

Nitty Gritty Details: `std::cin`

- First call to `std::cin >>` creates a command line prompt that allows the user to type until they hit enter
- Each `>>` ONLY reads until the next *whitespace*
 - Whitespace = tab, space, newline
- Everything after the first whitespace gets saved and used the next time `std::cin >>` is called
 - The place its saved is called a **buffer**!
- If there is nothing waiting in the buffer, `std::cin >>` creates a new command line prompt
- Whitespace is eaten: it won't show up in output

Stringstreams

- Input stream: `std::istringstream`
 - Give any data type to the `istringstream`, it'll store it as a string!
- Output stream: `std::ostringstream`
 - Make an `ostringstream` out of a string, read from it word/type by word/type!
- The same as the other i/o streams you've seen!

Questions?

Today

~~Streams recap~~

- Initialization
- References

Definition

Initialization: How we
provide initial
values to variables

Recall: Two ways to initialize a struct

```
Student s; // initialization after we declare  
s.name = "Sarah";  
s.state = "CA";  
s.age = 21;  
//is the same as ...
```

```
Student s = {"Sarah", "CA", 21};  
// initialization while we declare
```

Multiple ways to initialize a pair...

```
std::pair<int, string> numSuffix1 = {1, "st"};
```

```
std::pair<int, string> numSuffix2;
```

```
numSuffix2.first = 2;
```

```
numSuffix2.second = "nd";
```

```
std::pair<int, string> numSuffix2 =
```

```
std::make_pair(3, "rd");
```

Definition

Uniform initialization: curly
bracket initialization.

Available for all types,
immediate initialization on
declaration!

列表初始化

Uniform Initialization

```
std::vector<int> vec{1, 3, 5};
```

```
std::pair<int, string> numSuffix1{1, "st"};
```

```
Student s{"Sarah", "CA", 21};
```

// less common/nice for primitive types, but possible!

```
int x{5};
```

```
string f{"Sarah"};
```

Careful with Vector initialization!

$$3 \times 5 = 5, 5, 5$$

```
std::vector<int> vec1(3, 5);
```

// makes {5, 5, 5}, not {3, 5}!

// uses a std::initializer_list (more later)

```
std::vector<int> vec2{3, 5};
```

// makes {3, 5}

**TLDR: use uniform
initialization to initialize every
field of your non-primitive
typed variables - but be
careful not to use `vec(n, k)`!**

Questions?

Recap: Type Deduction with `auto`

自动类型推断.

Definition

auto: Keyword used in lieu of type when declaring a variable, tells the compiler to deduce the type.

Type Deduction using auto

```
// What types are these?  
auto a = 3;  
auto b = 4.3;  
auto c = 'X';  
auto d = "Hello";  
auto e = std::make_pair(3, "Hello");
```

 **auto** does not mean that the variable doesn't have a type.
It means that the type is deduced by the compiler.

Type Deduction using auto

```
// What types are these?  
auto a = 3;  
auto b = 4.3;  
auto c = 'X';  
auto d = "Hello";  
auto e = std::make_pair(3, "Hello");
```

Answers: int, double, char, char* (a C string), std::pair<int, char*>

 **auto** does not mean that the variable doesn't have a type.

It means that the type is **deduced** by the compiler.

!! `auto` does not mean that
the variable doesn't have a
type.

It means that the type is
deduced by the compiler.

When should we use auto?

Quadratic: Typing these types out is a pain...

```
int main() {  
    int a, b, c;  
    std::cin >> a >> b >> c;  
    std::pair<bool, std::pair<double, double>> result =  
                                                quadratic(a, b, c);  
  
    bool found = result.first;  
    if (found) {  
        std::pair<double, double> solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

Quadratic: Typing these types out is a pain...

cleaner code

```
int main() {  
    int a, b, c;  
    std::cin >> a >> b >> c;  
    auto result = quadratic(a, b, c);  
    bool found = result.first;  
    if (found) {  
        auto solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

Cleaner!

Don't overuse `auto`

Don't overuse auto!

```
int main() {  
    auto a, b, c;  
    std::cin >> a >> b >> c;  
    auto result = quadratic(a, b, c);  
    auto found = result.first;  
    if (found) {  
        auto solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

Typing these types out is a pain...

```
int main() {  
    auto a, b, c; //compile error!  
    std::cin >> a >> b >> c;  
    auto result = quadratic(a, b, c);  
    auto found = result.first;  
    if (found) {  
        auto solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

ERROR!

Typing these types out is a pain...

```
int main() {  
    int a, b, c;  
    std::cin >> a >> b >> c;  
    auto result = quadratic(a, b, c);  
    auto found = result.first; //code less clear :/  
    if (found) {  
        auto solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

LESS CLEAR 👎 😞

Don't overuse **auto**

...but use it to reduce long type names

std::string

std::vector

std::pair

Questions?

Structured Binding

Structured binding lets you initialize **directly** from the contents of a struct

Before

```
auto p =  
    std::make_pair("s", 5);  
string a = s.first;  
int b = s.second;
```

After

```
auto p =  
    std::make_pair("s", 5);  
auto [a, b] = p;  
// a is string, b is int  
// auto [a, b] =  
    std::make_pair(...);
```

This works for regular structs, too. Also, no nested structured binding.

A better way to use quadratic

```
int main() {  
    auto a, b, c;  
    std::cin >> a >> b >> c;  
    auto result = quadratic(a, b, c);  
    auto found = result.first;  
    if (found) {  
        auto solutions = result.second;  
        std::cout << solutions.first << solutions.second << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

A better way to use quadratic

```
int main() {  
    auto a, b, c;  
    std::cin >> a >> b >> c;  
    auto [found, solutions] = quadratic(a, b, c);  
    if (found) {  
        auto [x1, x2] = solutions;  
        std::cout << x1 << " " << x2 << endl;  
    } else {  
        std::cout << "No solutions found!" << endl;  
    }  
}
```

This is better is because it's *semantically clearer*: variables have clear names.

Questions?

- ~~Streams recap~~
- ~~Initialization~~
- References

Definition

Reference: An alias
(another name) for a
named variable

References in 106B

```
void changeX(int& x) { // changes to x will persist
    x = 0;
}
void keepX(int x) {
    x = 0;
}

int a = 100;
int b = 100;

changeX(a); // a becomes a reference to x
keepX(b);   // b becomes a copy of x

cout << a << endl; //0
cout << b << endl; //100
```

Standard C++ vector (intro)

Stanford Vector vs Standard std::vector

Vector

```
Vector<int> v;  
Vector<int> v(n, k);  
v.add(k);  
v[i] = k;  
auto k = v[i];  
  
v.isEmpty();  
v.size();  
v.clear();  
v.insert(i, k);  
v.remove(i);
```

std::vector

```
std::vector<int> v;  
std::vector<int> v(n, k);  
v.push_back(k);  
v[i] = k;  
auto k = v[i];  
  
v.empty();  
v.size();  
v.clear();  
// stay tuned  
// stay tuned
```

References in 106L: References to variables

```
vector<int> original{1, 2};  
vector<int> copy = original;  
vector<int>& ref = original;  
original.push_back(3);  
copy.push_back(4);  
ref.push_back(5);
```

```
cout << original << endl;  
cout << copy << endl;  
cout << ref << endl;
```

References to variables

```
vector<int> original{1, 2};  
vector<int> copy = original;  
vector<int>& ref = original;  
original.push_back(3);  
copy.push_back(4);  
ref.push_back(5);  
  
cout << original << endl; // {1, 2, 3, 5}  
cout << copy << endl;  
cout << ref << endl;
```

References to variables

```
vector<int> original{1, 2};  
vector<int> copy = original;  
vector<int>& ref = original;  
original.push_back(3);  
copy.push_back(4);  
ref.push_back(5);
```

```
cout << original << endl; // {1, 2, 3, 5}  
cout << copy << endl;    // {1, 2, 4}  
cout << ref << endl;
```

References to variables

```
vector<int> original{1, 2};  
vector<int> copy = original;  
vector<int>& ref = original;  
original.push_back(3);  
copy.push_back(4);  
ref.push_back(5);
```

```
cout << original << endl; // {1, 2, 3, 5}  
cout << copy << endl;    // {1, 2, 4}  
cout << ref << endl;     // {1, 2, 3, 5}
```

References to variables

```
vector<int> original{1, 2};  
vector<int> copy = original;  
vector<int>& ref = original;  
original.push_back(3);  
copy.push_back(4);  
ref.push_back(5);
```

} “=” automatically makes
a copy! Must use & to
avoid this.

```
cout << original << endl; // {1, 2, 3, 5}  
cout << copy << endl;    // {1, 2, 4}  
cout << ref << endl;     // {1, 2, 3, 5}
```

The classic reference-copy bug:

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (size_t i = 0; i < nums.size(); ++i) {  
        auto [num1, num2] = nums[i];  
        num1++;  
        num2++;  
    }  
}
```

The classic reference-copy bug:

遍历

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (size_t i = 0; i < nums.size(); ++i) {  
        auto [num1, num2] = nums[i];  
        num1++;  
        num2++;  
    }  
}
```

This is updating that same
copy!

This creates a copy of the
course

The classic reference-copy bug:

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (auto [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}
```

The classic reference-copy bug:

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (auto [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}
```

This is updating that same
copy!

This creates a copy of the
course

The classic reference-copy bug, fixed:

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (auto& [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}
```

Definition: l-values vs r-values

- l-values can appear on the left or right of an =
- x is an l-value

```
int x = 3;  
int y = x;
```

l-values have names

l-values are not temporary

Definition: l-values vs r-values

- **l-values** can appear on the **left** or **right** of an =
- **x** is an **l-value**

```
int x = 3;  
int y = x;
```

l-values have names

l-values are not temporary

- **r-values** can ONLY appear on the **right** of an =
- **3** is an **r-value**

```
int x = 3;  
int y = x;
```

r-values don't have names

r-values are temporary

The classic reference-rvalue error

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (auto& [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}
```

```
shift({{1, 1}});
```

The classic reference-rvalue error

```
void shift(vector<std::pair<int, int>>& nums) {  
    for (auto& [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}
```

```
shift({{1, 1}});
```

```
// {{1, 1}} is an rvalue, it can't be referenced
```

The classic reference-rvalue error, fixed

```
void shift(vector<pair<int, int>>& nums) {  
    for (auto& [num1, num2]: nums) {  
        num1++;  
        num2++;  
    }  
}  
  
auto my_nums = {{1, 1}};  
shift(my_nums);
```

Note: You can only create references to variables

```
int& thisWontWork = 5; // This doesn't work!
```

aka

Questions?

BONUS: Const and Const References

`const` indicates a variable can't be modified!

const variables can be references or not!

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};    // a const variable  
std::vector<int>& ref = vec;            // a regular reference  
const std::vector<int>& c_ref = vec;    // a const reference  
  
vec.push_back(3);  
c_vec.push_back(3);  
ref.push_back(3);  
c_ref.push_back(3);
```

`const` indicates a variable can't be modified!

const variables can be references or not!

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};    // a const variable  
std::vector<int>& ref = vec;             // a regular reference  
const std::vector<int>& c_ref = vec;    // a const reference  
  
vec.push_back(3);    // OKAY  
c_vec.push_back(3);  
ref.push_back(3);  
c_ref.push_back(3);
```

`const` indicates a variable can't be modified!

const variables can be references or not!

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};    // a const variable  
std::vector<int>& ref = vec;            // a regular reference  
const std::vector<int>& c_ref = vec;    // a const reference  
  
vec.push_back(3);    // OKAY  
c_vec.push_back(3);  // BAD - const  
ref.push_back(3);  
c_ref.push_back(3);
```

`const` indicates a variable can't be modified!

const variables can be references or not!

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};    // a const variable  
std::vector<int>& ref = vec;             // a regular reference  
const std::vector<int>& c_ref = vec;    // a const reference  
  
vec.push_back(3);    // OKAY  
c_vec.push_back(3);  // BAD - const  
ref.push_back(3);    // OKAY  
c_ref.push_back(3);
```

`const` indicates a variable can't be modified!

const variables can be references or not!

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};    // a const variable  
std::vector<int>& ref = vec;             // a regular reference  
const std::vector<int>& c_ref = vec;    // a const reference  
  
vec.push_back(3);    // OKAY  
c_vec.push_back(3);  // BAD - const  
ref.push_back(3);    // OKAY  
c_ref.push_back(3);  // BAD - const
```

Can't declare non-const reference to const variable!

```
const std::vector<int> c_vec{7, 8};    // a const variable  
  
// BAD - can't declare non-const ref to const vector  
std::vector<int>& bad_ref = c_vec;
```

Can't declare non-const reference to const variable!

```
const std::vector<int> c_vec{7, 8};    // a const variable  
  
// fixed  
const std::vector<int>& bad_ref = c_vec;
```

Can't declare non-const reference to const variable!

```
const std::vector<int> c_vec{7, 8};    // a const variable

// fixed

const std::vector<int>& bad_ref = c_vec;

// BAD - Can't declare a non-const reference as equal
// to a const reference!

std::vector<int>& ref = c_ref;
```

const & subtleties

```
std::vector<int> vec{1, 2, 3};  
const std::vector<int> c_vec{7, 8};
```

```
std::vector<int>& ref = vec;  
const std::vector<int>& c_ref = vec;
```

```
auto copy = c_ref;           // a non-const copy  
const auto copy = c_ref;     // a const copy  
auto& a_ref = ref;           // a non-const reference  
const auto& c_aref = ref;    // a const reference
```

Remember: C++, by default, makes copies when we do variable assignment! We need to use & if we need references instead.

When do we use references/const references?

- If we're working with a variable that takes up little space in memory (e.g. int, double), we don't need to use a reference and can just copy the variable
- If we need to alias the variable to modify it, we can use references
- If we don't need to modify the variable, but it's a big variable (e.g. std::vector), we can use const references

You can return references as well!

```
// Note that the parameter must be a non-const reference to return  
// a non-const reference to one of its elements!
```

```
int& front(std::vector<int>& vec) {  
    // assuming vec.size() > 0  
    return vec[0];  
}
```

```
int main() {  
    std::vector<int> numbers{1, 2, 3};  
    front(numbers) = 4; // vec = {4, 2, 3}  
    return 0;  
}
```

Can also return const references

```
const int& front(std::vector<int>& vec) {  
    // assuming vec.size() > 0  
    return vec[0];  
}
```

Questions?

Recap:

- **Uniform Initialization**
 - A “uniform” way to initialize variables of different types!
- **References**
 - Allow us to alias variables
- **Const**
 - Allow us to specify that a variable can't be modified
